Concl
its corresponding unique ID. Appendix B shows an example application HelloSmartCard.java, with a table below illustrating the IDs corresponding to the strings found in the constant pool of the class file for this application. The IDs used for this example are 16-bit unsigned integers.--

In the Drawings:

A Proposed Drawing Amendment for Approval by the Examiner accompanies this communication. The proposed corrections to Figs. 4, 16 & 18 are marked in red ink on copies of the original drawings.

In the Claims:

~~Please cancel Claims 1-105 without prejudice.~~

~~Please add the following new Claims:~~

~~126 106.
145. A microcontroller comprising:
a memory storing:
a derivative application derived from an application having a class
file format wherein the application is derived from an application having a
class file format by first compiling the application having a class file
format into a compiled form and then converting the compiled form into a
converted form, and
an interpreter configured to interpret applications derived from
applications having a class file format; and
a processor coupled to the memory, the processor configured to use the
interpreter to interpret the derivative application for execution.~~

~~107.
146. The microcontroller of claim 145, further comprising:
a communicator configured to communicate with a terminal.~~

*R1.12.6
Sub P1*

108. 147. The microcontroller of claim *147*, wherein the terminal has a card reader and the communicator comprises a contact for communicating with the card reader.

109. 148. The microcontroller of claim *147*, wherein the terminal has a wireless communicator and a wireless transceiver for communicating with the wireless communication device.

110. 149. The microcontroller of claim *147*, wherein the terminal has a wireless communication device and the communicator comprises a wireless transmitter for communicating with the wireless communication device.

111. 150. The microcontroller of claim *145*, wherein the class file format comprises a Java class file format.

112. 151. A microcontroller having a set of resource constraints and comprising:
a memory, and
an interpreter loaded in memory and operable within the set of resource constraints,
the microcontroller having: at least one application loaded in the memory to be interpreted by the interpreter, wherein the at least one application is generated by a programming environment comprising:
a) a compiler for compiling application source programs written in high level language source code form into a compiled form, and
b) a converter for post processing the compiled form into a minimized form suitable for interpretation within the set of resource constraints by the interpreter.

113. 152. The microcontroller of Claim *151*, wherein the compiled form includes attributes, and the converter comprises a means for including attributes required by the interpreter while not including the attributes not required by the interpreter.

R1.13 C
PP

~~114.~~ ¹¹² The microcontroller of Claim ~~151~~ wherein the compiled form is in a standard Java class file format and the converter accepts as input the compiled form in the standard Java class file format and produces output in a form suitable for interpretation by the interpreter.

~~115.~~ ¹¹² ~~154.~~ The microcontroller of Claim ~~151~~ wherein the compiled form includes associating an identifying string for objects, classes, fields, or methods, and the converter comprises a means for mapping such strings to unique identifiers.

~~116.~~ ¹¹⁵ ~~155.~~ The microcontroller of Claim ~~154~~ wherein each unique identifier is an integer.

~~117.~~ ¹¹⁵ ~~156.~~ The microcontroller of Claim ~~154~~ wherein the mapping of strings to unique identifiers is stored in a string to identifier map file.

~~118.~~ ¹¹² ~~157.~~ The microcontroller of Claim ~~151~~ wherein the high level language supports a first set of features and a first set of data types and the interpreter supports a subset of the first set of features and a subset of the first set of data types, and wherein the converter verifies that the compiled form only contains features in the subset of the first set of features and only contains data types in the subset of the first set of data types.

~~119.~~ ¹¹⁵ ~~158.~~ The microcontroller of Claim ~~154~~ wherein the compiled form is in a byte code format and the converter comprises means for translating from the byte codes in the compiled form to byte codes in a format suitable for interpretation by the interpreter by:

using at least one step in a process including the steps:

- a) recording all jumps and their destinations in the original byte codes;
- b) converting specific byte codes into equivalent generic byte codes or vice-versa;
- c) modifying byte code operands from references using identifying strings to references using unique identifiers; and
- d) renumbering byte codes in the compiled form to equivalent byte codes in the format suitable for interpretation; and

sub b1
d).

relinking jumps for which destination address is effected by conversion step a), b), c), or

P1.126

~~120.~~ 159. The microcontroller of Claim ~~151~~¹¹² wherein the application program is compiled into a compiled form for which resources required to execute or interpret the compiled form exceed those available on the microcontroller.

~~121.~~ 160. The microcontroller of Claim ~~151~~¹¹² wherein the compiled form is designed for portability on different computer platforms.

~~122.~~ 161. The microcontroller of Claim ~~151~~¹¹² wherein the interpreter is further configured to determine, during an interpretation of an application, whether the application meets a security criteria selected from a set of rules containing at least one rule selected from the set:

not allowing the application access to unauthorized portions of memory,
not allowing the application access to unauthorized microcontroller resources,
wherein the application is composed of byte codes and checking a plurality of byte codes at least once prior to execution to verify that execution of the byte codes does not violate a security constraint.

~~123.~~ 162. The microcontroller of Claim ~~151~~¹¹² wherein at least one application program is generated by a process including the steps of:

prior to loading the application verifying that the application does not violate any security constraints; and
loading the application in a secure manner.

~~124.~~ 163. The microcontroller of Claim ~~162~~¹²³ wherein the step of loading in a secure manner comprises the step of:

verifying that the loading identity has permission to load applications onto the microcontroller.

125. ~~164.~~ The microcontroller of Claim ~~162~~ ¹²³ wherein the step of loading in a secure manner comprises the step of:
encrypting the application to be loaded using a loading key.

126. ~~165.~~ A method of programming a microcontroller having a memory and a processor operating according to a set of resource constraints, the method comprising the steps of:
inputting an application program in a first programming language;
compiling the application program in the first programming language into a first intermediate code associated with the first programming language, wherein the first intermediate code being interpretable by at least one first intermediate code virtual machine;
converting the first intermediate code into a second intermediate code; wherein the second intermediate code is interpretable within the set of resource constraints by at least one second intermediate code virtual machine; and
loading the second intermediate code into the memory of the microcontroller.

127. ~~166.~~ The method of programming a microcontroller of Claim ~~165~~ ¹²⁶ wherein the step of converting further comprises:
associating an identifying string for objects, classes, fields, or methods; and
mapping such strings to unique identifiers.

128. ~~167.~~ The method of Claim ~~166~~ ¹²⁷ wherein the step of mapping comprises the step of mapping strings to integers.

129. ~~168.~~ The method of Claim ~~165~~ ¹²⁶ wherein the step of converting comprises at least one of the steps of:
a) recording all jumps and their destinations in the original byte codes;
b) converting specific byte codes into equivalent generic byte codes or vice-versa;
c) modifying byte code operands from references using identifying strings to references using unique identifiers;

Sub b1

- d) renumbering byte codes in a compiled format to equivalent byte codes in a format suitable for interpretation; and
- e) relinking jumps for which destination address is effected by conversion step a), b), c), or d).

21.126

130 126
169. The method of Claim 165 wherein the step of loading the second intermediate code into the memory of the microcontroller further comprises checking the second intermediate code prior to loading the second intermediate code to verify that the second intermediate code meets a predefined integrity check and that loading is performed according to a security protocol.

131 130
170. The method of Claim 169 wherein the security protocol requires that a particular identity must be validated to permit loading prior to the loading of the second intermediate code.

132 130
171. The method of Claim 169 further characterized by providing a decryption key and wherein the security protocol requires that the second intermediate code is encrypted using a loading key corresponding to the decryption key.

133.
172. A microcontroller operable to execute derivative programs which are derivatives of programs written in an interpretable programming language having a memory and an interpreter, the microcontroller comprising:

- (a) the microcontroller operating within a set of resource constraints including the memory being of insufficient size to permit interpretation of programs written in the interpretable programming language; and
- (b) the memory containing an interpreter operable to interpret the derivative programs written in the derivative of the interpretable language wherein a derivative of a program written in the interpretable programming language is derived from the program written in the interpretable programming language by applying at least one rule selected from a set of rules including:
 - (1) mapping strings to identifiers;

131

(2) performing security checks prior to or during interpretation;
(3) performing structural checks prior to or during interpretation; and
(4) performing semantic checks prior to or during interpretation.

132

134. *173.* The microcontroller of Claim *172* wherein the derivative programs are class files or derivatives of class files.

135.

174. The microcontroller of Claim *172* further comprising:
the memory containing less than 1 megabyte of storage.

136.

175. The microcontroller of Claim *172* wherein the security checks the microcontroller is further comprising:
(c) logic to receive a request from a requester to access one of a plurality of derivative programs;
(d) after receipt of the request, determine whether the one of a plurality of derivative programs complies with a predetermined set of rules; and
(e) based on the determination, selectively grant access to the requester to the one of the plurality of applications.

~~ABSTRACT~~
~~COMPARISON~~
~~DESCRIPTION~~
~~DRAWINGS~~

137.

176. The microcontroller of Claim *175*, wherein the predetermined rules are enforced by the interpreter while the derivative program is being interpreted by determining whether the derivative program has access rights to a particular part of memory the derivative program is attempting to access.

138.

177. The microcontroller of Claim *172* further wherein the microcontroller is configured to perform at least one security check selected from the set having the members:

(a) enforcing predetermined security rules while the derivative program is being interpreted, thereby preventing the derivative program from accessing

Jul 18
131. unauthorized portions of memory or other unauthorized microcontroller resources,

f1.126

(b) the interpreter being configured to check each bytecode at least once prior to execution to determine that the bytecode can be executed in accordance with pre-execution and post-execution checks, and

(c) the derivative program is checked prior to being loaded into the microcontroller to verify the integrity of the derivative program and loading is performed according to a security protocol.

131. 138. ~~178.~~ The microcontroller of ~~Claim 177~~ wherein the security protocol requires that a particular identity must be validated to permit loading a derivative program onto a card.

140. 138. ~~179.~~ The microcontroller of ~~Claim 177~~ further comprising a decryption key wherein the security protocol requires that a derivative program to be loaded is encrypted using a loading key corresponding to the decryption key.

141. 133. ~~180.~~ The microcontroller of ~~Claim 172~~ wherein the microcontroller is configured to provide cryptographic services selected from the set including encryption, decryption, signing, signature verification, mutual authentication, transport keys, and session keys.

142. 133. ~~181.~~ The microcontroller of ~~Claim 172~~ further comprising a file system and wherein the microcontroller is configured to provide secure access to the file system through a means selected from the set including:

(a) the microcontroller having access control lists for authorizing reading from a file, writing to a file, or deletion of a file,

(b) the microcontroller enforcing key validation to establish the authorized access to a file, and

(c) the microcontroller verifying card holder identity to establish the authorized access to a file.

143
182.

An integrated circuit card for use with a terminal, comprising:
a communicator configured to communicate with the terminal;
a memory storing:
an application derived from a program written in a high level
programming language format wherein the application is derived from a
program written in a high level programming language format by first
compiling the program into a compiled form and then converting the
compiled form into a converted form, the converting step including
modifying byte code operands from references using identifying strings to
references using unique identifiers; and
an interpreter operable to interpret such an application derived
from a program written in a high level programming language format; and
a processor coupled to the memory, the processor configured to use the
interpreter to interpret the application for execution and to use the communicator
to communicate with the terminal.

144.

183. The integrated circuit card of Claim 182 wherein the converting step further
comprises:
recording all jumps and their destinations in the original byte codes;
converting specific byte codes into equivalent generic byte codes or vice-
versa; and
renumbering byte codes in a compiled format to equivalent byte codes in a
format suitable for interpretation.

145.
184.

A method for use with an integrated circuit card and a terminal, comprising:
storing an interpreter operable to interpret programs derived from
programs written in a high level programming language and an application
derived from a program written in a high level programming language format in a
memory of the integrated circuit card wherein the application is derived from a
program written in a high level programming language format by first compiling.

Sub P1

the program into a compiled form and then converting the compiled form into a converted form, the converting step including modifying byte code operands from references using identifying strings to references using unique identifiers; and

using a processor of the integrated circuit card to use the interpreter to interpret the application for execution; and

using a communicator of the card when communicating between the processor and the terminal.

11.126

146.
185.

145

The method of Claim 184 wherein the converting step further comprises:

recording all jumps and their destinations in the original byte codes;

converting specific byte codes into equivalent generic byte codes or vice-versa; and

renumbering byte codes in a compiled format to equivalent byte codes in a format suitable for interpretation.

147.
186.

An integrated circuit card for use with a terminal, comprising:

a communicator configured to communicate with the terminal;

a memory storing:

applications, each application derived from applications having a high level programming language format, and

an interpreter operable to interpret applications derived from applications having a high level programming language format wherein the application is derived from a program written in a high level programming language format by first compiling the program into a compiled form and then converting the compiled form into a converted form, the converting step including modifying byte code operands from references using identifying strings to references using unique identifiers; and

Mark b1
a processor coupled to the memory, the processor configured to:

- a.) use the interpreter to interpret the applications for execution,
- b.) use the interpreter to create a firewall to isolate the applications from each other, and
- c.) use the communicator to communicate with the terminal.

PL.126

148. 187. The integrated circuit card of Claim *186* wherein the interpreter is further operable to interpret applications derived using a converting step including:

*Ab
cancel*

- recording all jumps and their destinations in the original byte codes;
- converting specific byte codes into equivalent generic byte codes or vice-versa; and
- renumbering byte codes in a compiled format to equivalent byte codes in a format suitable for interpretation.

149.

188. A microcontroller operable to execute derivative programs which are derivatives of programs written in an interpretable programming language having a memory and an interpreter, the microcontroller comprising:

- the microcontroller operating within a set of resource constraints including the memory being of insufficient size to permit interpretation of programs written in the interpretable programming language; and
- the memory containing an interpreter operable to interpret the derivative programs written in the derivative of the interpretable language wherein a derivative of a program written in the interpretable programming language is derived from the program written in the interpretable programming language by mapping strings to identifiers.--
